

**Event Log View** gives you a consolidated view of multiple event logs remotely so you can identify patterns in behavior and report on specific events to improve post-event diagnosis. Unlike most other event log viewing software, Event Log View allows you to do searches on logs in the native form in order to find values in specific fields.

**Event Log View** provides you with comprehensive and powerful filters plus the ability to create and store customized filters. Also, Event Log view is able to display complete event header information and makes it possible to sort all reports by any of the event header categories. Event Log View also gives you a description box for further inquiry into specific event details accessed by clicking on an individual event.

- Consolidated view of all servers' event logs
- Examine multiple remote event logs fast and efficiently
- Filter tree for easy access to all filters
- Filter in events based on all fields in the event header
- Filter in events based on Parameters
- Filter in range of eventIDs
- Search by date range
- Optimize query by number of hours and number of events
- Create and store machine lists to group similar machines together (i.e. mailservers, web servers, domain controllers, critical workstations)

Feature	Benefits
Consolidated View of Multiple Event logs	Easily identify patterns across servers and domains to locate security holes and server health issues
Comprehensive Standard Event Filters and Ability to customize Filter with flexible query parameters	Query event log information for specific events relevant to server health or security problems.
Single interface for viewing Multiple Event Logs	Reduced labor costs plus easy access to mission-critical and security events to decrease response time
Auditing and reporting capabilities	Historical overview of all event types from multiple event logs
